Statistics:

Database:

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Mean 47.512; Variance 117.669; scale 0.404

MPsrch\_pp protein - protein database search, using Smith-Waterman algorithm

Tabular output not generated. Run on: Tue Sep 26 16:14:59 2000; MasPar time 9.09 Seconds 606.971 Million cell updates/sec

Description: Perfect Score: Title: >US-09-308-435-2
(28-260) from US09308435.pep
1594
1 CSPHIIETNEVALKLNYHPA.....QKNLESYQKDAKELKGKRNR 233

Scoring table: Sequence: PAM 150 Gap 11

Post-processing: Minimum Match 0% Listing first 45 summaries

Searched:

188963 seqs, 23686106 residues

Database:

a-geneseq36 1:geneseqp

Statistics: Mean 32.420; Variance 175.543; scale 0.185

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Helicobacter pylori surface exposed antigen - useful for treatment, prophylaxis or diagnosis of mammalian infections (laim 2; Page 34-35; 49pp; English.

Ke Laim 2; Page 34-35; 49pp; English.

Ke A 29 kDa antigen (W07449) of Helicobacter pylori is an adhesin expressed on the surface of resting and dividing forms of the bacterium. It is conserved in all tested strains of H. pylori, and gives rise to both systemic and local (mucosal) prodn. of antibodies. Its amino acid sequence was deduced from a cDNA clone (T43834); a sequence (W07550) deduced from a second cDNA clone (T43835) differs only at position 222 (Arg for Ser). Recombinant antigen can be produced in transformed host cells. It is useful for the diagnosis and treatment of H. pylori infections and for use as a vaccine.
                                                                                                                                                                                                                                                                                                                                                                                            Matches

PT useful in the diagnosis and treatment of H. pylori
PS Claim 2; Page 20-21; 32pp; English.

CC This sequence represents the fusion protein of the invention, between the
CC This protein is used in the diagnosis of and as a vaccine against
CC This protein is used in the diagnosis of and as a vaccine against
CC Unicers. It may also be used in the production of an anti-H. pylori
CC antibody. Vectors containing the DNA sequence and E. coli strains
CC containing it form the basis of a process to produce the protein; which
CC consists of culturing the microorganism and obtaining the protein: The
CC protein is an effective vaccine against H. pylori due to its excellent
CC immunogenicity for H. pylori, stability within the stomach environment,
CC and its ability to penetrate through the stomach mucous membrane to
CC stimulate sigh production.

This polypeptide comprises a 29 kDa surface antigen which is carperssed on the surface of both dividing (bacillary) and resting (colloid) forms of Helicobacter pylori. The antigen gives rise to both systemic and local (mucosal) production of antibodies. It is and is also a putative virulence factor. The invention relates to an ey pharmaceutical composition comprising a lipid aggregate of a new pharmaceutical composition comprising a lipid aggregate of a negatively charged lipid or lipid mixture and at least one antigenic, native or recombinant antigen of H. pylori, preferably the surface-exposed 29 kDa antigen, or a nucleic acid (see V3464) coding for such an antigen. The new formulations, which are useful as vaccine formulations, elicit a protective immune response capainst H. pylori infections, and are suitable for therapeutic and prophylactic use. An adequate response is produced even without adjuvant. A second, claimed 29 kDa antigen (see W60156) is provided that differs only at residue 222 (ser for Arg).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Query Match

CA 29 kDa antigen (W07450) of Helicobacter pylori is an adhesin conserved in all tested strains of H. pylori, and gives rise to both systemic and local (mucosal) prodn. Of antibodies. Its amino acid sequence was deduced from a cDNA clone (T43834); a sequence (W07549) deduced from a second cDNA clone (T43834) differs only at position 222 (Ser for Arg). Recombinant cantigen can be produced in transformed host cells. It is useful for the diagnosts and treatment of H. pylori infections and for use as a vaccine.

Recombinant or substantially pure preparations of H. pylori polypeptides are disclosed, together with the nucleic acids encoding them. In all, 73 ORFs are shown. The proteins are variously cell envelope proteins, secreted proteins or other cellular proteins. Vaccines containing the nucleic acids or proteins are claimed, as are probes containing at least 8 nucleotides from the nucleic acid sequences. The vaccines are useful for treating or reducing the risk of H. pylori infections, and the probes can be used diagnostically for detecting the presence of Helicobacter in a sample. The products are also of use in screening for compounds having the ability to interfere with the H. pylori life cycle or to inhibit H. pylori infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      08-JUN-1999 (first entry)

This sequence represents a H. pylori protein.

This sequence represents a H. pylori protein.

The protein may be used in a vaccine to prevent or treat H. pylori infection or to identify H. pylori polypeptide binding compounds; useful as potential H. pylori life cycle activators or inhibitors.

The genomic sequence of H. pylori (ATCC 55679) was determined from coverlapping contigs generated by mechanically shearing the bacterial DNA. The sequences were analysed for ORF of at least 180 nucleotides, and the predicted coding regions defined by computer evaluation. To identify likely H. pylori antigens for vaccine development, the amino acid sequences predicted from various ORF were analysed for significant homology to other known or exported membrane proteins. Having identified and determined the sequences of interest, particular regions can be isolated from H. pylori aby PCR amplification for recombinant polypeptide production, e.g. in E. coli hosts.

                                                                                                                                                                                                                                                                                                                                                               ğ
                                                                                                                                                                                                                                                                                                                                                                                                                                밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            CC This sequence represents an H. pylori derived protein, no further CC details are given in the specification.

CC Helicobacter pylori has been strongly linked to chronic gastritis and CC duodenal ulcer disease. The nucleic acid sequences of the invention CC are used to evaluate compounds, especially activators or inhibitors of CC bacterial life cycle, for the ability to bind an H. pylori nucleic acid sequence. The nucleic acid sequences, and corresponding proteins, are CC expense. The nucleic acid sequences, and corresponding proteins are CC used to inhibit expression of a gene from Helicobacter species in CC a sample. Antisense nucleic acid sequences of these sequences are Used to inhibit expression of a gene from Helicobacter species. H. CC pylori whole genomic DNA was isolated and nebulsed to a median size of BSTXI-linker adapters in 100-1000 fold molar excess. These linkers are CC complementary to the BSTXI-cut pMPX vectors, while the overhang is not complementary. Therefore the linkers will not concatemerise nor CC will the cut vector re-ligate itself easily. The linker-adapter inserts shotoun subclone libraries. The purified DNA samples were then
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ş

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The protein may be used in a vaccine to prevent or treat H. pylori infection or to identify H. pylori polypeptide binding compounds, useful as potential H. pylori life cycle activators or inhibitors. The genomic sequence of H. pylori (ATCC 55679) was determined from coverlapping contigs generated by mechanically shearing the bacterial DNA. The sequences were analysed for ORF of at least 180 nucleotides, and the predicted coding regions defined by computer evaluation. To identify likely H. pylori antigens for vaccine development, the amino acid sequences predicted from various ORF were analysed for significant homology to other known or exported membrane proteins. Having identified and determined the sequences of interest, particular regions can be isolated from H. pylori by PCR amplification for recombinant polypeptide production, e.g. in E. coli hosts.

Helicobacter pylori nucleic acid sequences and encoded polypeptide(s) - useful in vaccines to treat or prevent H. pylori infection and for diagnosis of H. pylori infection Claim 14; Pages 558-559; 1145pp; English.

This sequence is a H. pylori protein of unspecified function. This sequence is a H. pylori protein to prevent or treat H. pylori infection or to identify H. pylori polypeptide binding compounds, useful as potential H. pylori life cycle activators or inhibitors. The DNA and probes derived from it may be used for the identification of the pylori in a sample and the diagnosis of H. pylori infection. Nucle
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                can be used to prevent the translation of H. pylori mRNA. Antibodies against the protein can be used in immunoassays to evaluate the abundance and distribution of H. pylori-specific antigens. The genomic sequence of H. pylori (ATCC 55679) was determined from overlapping contigs generated by mechanically shearing the bacterial DNA. The sequences were analysed for ORF of at least 180 nucleotides, and the predicted coding regions defined by computer evaluation. To identify likely H. pylori antigens for vaccine development, the amino acid sequences predicted from various ORF were analysed for significant homology to other known or exported membrane proteins. Having identified and determined the sequences of interest, particular regions can be isolated from H. pylori by PCR amplification for recombinant polypeptide production, e.g. in E. coli
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Location/Qualifiers

Antibodies against the protein can be used in immunoassays to evaluate the abundance and distribution of H. pylori-specific antigens. The genomic sequence of H. pylori (ATCC 55679) was determined from overlapping contigs generated by mechanically shearing the bacterial DNA. The sequences were analysed for ORF of at least 180 nucleotides, and the predicted coding regions defined by computer evaluation. To identify likely H. pylori antigens for vaccine development, the amino acid sequences predicted from various ORF were analysed for significant homology to other known or exported membrane proteins. Having identified and determined the sequences of interest, particular regions can be isolated from H. pylori by PCR.
                                                                                                                                                                                New isolated Helicobacter polynucleotides - used to develop products for the diagnosis, prevention and treatment of Helicobacter infections and gastrointestinal diseases claim 8; Page 455-456; 2054pp; English.

This sequence represents a Helicobacter pylori GHPO protein of the invention. The polypeptides can be used for preventing or treating Helicobacter infections, and gastroduodenal diseases associated with these infections, including acute, chronic, and atrophic gastritis, and peptic ulcer diseases, e.g. gastric and duodenal ulcers. They can also used for the production of antibodies. The products can also be used for the production of antibodies.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         H. pylori GHPO 1615 protein.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Recombinant or substantially pure preparations of H. pylori polypeptides are disclosed, together with the nucleic acids encoding them. In all, 73 ORFs are shown. The proteins are variously cell envelope proteins, secreted proteins or other cellular proteins. Vaccines containing the nucleic acids or proteins are claimed, as are probes containing at least 8 nucleic acids from the nucleic acid sequences. The vaccines are useful for treating or reducing the risk of H. pylori infections, and the probes can be used diagnostically for detecting the presence of Helicobacter in a sample. The products are also of use in screening for compounds having the ability to interfere with the H. pylori life cycle or to inhibit H. pylori infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         secreted protein; cellular protein.

PS Claim 72; Page 1333-1334; 1481pp; English.

CC The present sequence is a H. pylori secreted or periplasmic protein.

CC The protein may be used in a vaccine to prevent or treat H. pylori

CC infection or to identify H. pylori polypeptide binding compounds,

CC useful as potential H. pylori life cycle activators or inhibitors.

CC useful as potential H. pylori life cycle activators or inhibitors.

CC the genomic sequence of H. pylori (ATCC 55679) was determined from

CC overlapping contigs generated by mechanically shearing the bacterial

CC DNA. The sequences were analysed for ORF of at least 180 nucleotides,

CC identify likely H. pylori antigens for vaccine development, the amino

CC acid sequences predicted from various ORF were analysed for significant

CC homology to other known or exported membrane proteins. Having identified

CC and determined the sequences of interest, particular regions can be

CC isolated from H. pylori by PCR amplification for recombinant polypeptide

CC production, e.g. in E. coli hosts.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Query Match

problypeptide(s) - useful for vaccines to treat or prevent H. pylori prinfection, and to detect Helicobacter

Problypeptide(s) - useful for vaccines to treat or prevent H. pylori prinfection, and to detect Helicobacter

Problypeptide(s) - useful for vaccine to prevent or periplasmic protein. The protein may be used in a vaccine to prevent or treat H. pylori CC Infection or to identify H. pylori polypeptide binding compounds, consecution or to identify H. pylori (ATCC 55679) was determined from CC useful as potential H. pylori (ATCC 55679) was determined from CC overlapping contigs generated by mechanically shearing the bacterial CC DNA. The sequences were analysed for ORF of at least 180 nucleotides, and the predicted coding regions defined by computer evaluation. To identify likely H. pylori antigens for vaccine development, the amino CC acid sequences predicted from various ORF were analysed for significant CC homology to other known or exported membrane proteins. Having identified and determined the sequences of interest, particular regions can be collated from H. pylori by PCR amplification for recombinant polypeptide production, e.g. in E. coli hosts.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Berglindh

5:sp\_invertebrate 6:sp\_mammal 7:sp\_mhc 8:sp\_organelle
9:sp\_phage 10:sp\_plant 11:sp\_rodent 12:sp\_unclassified
13:sp\_vertebrate 14:sp\_virus

Statistics: Mean 46.291; Variance 102.838; scale 0.450

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

## ALIGNMENTS

CC (T4383); a sequence (W07549) deduced from a second cDNA clone CC (T43834) differs only at position 222 (Ser for Arg). Recombinant CC antigen can be produced in transformed host cells. It is useful CC for the diagnosis and treatment of H. pylori infections and for CC use as a vaccine.  SQ sequence 250 AA;  Query Match  100.0%; Score 1599; DB 1; Length 260;  Best Local Similarity 100.0%; pred. No. 2.57e-113;

                                                                                                                                                                                                                                                                                               ps Disclosure; Page 35-36; 5lpp; English.

This polypeptide comprises a 29 kDa surface antigen which is carpressed on the surface of both dividing (bacillary) and resting (colloid) forms of Helicobacter pylori. The antigen gives rise to both systemic and local (mucosal) production of antibodies. It is an adhesin that is conserved in all tested strains of H. pylori, and is also a putative virulence factor. The invention relates to negatively charged lipid or lipid mixture and at least one antigenic, native or recombinant antigen of H. pylori, preferably the surface-exposed 29 kDa antigen, or a nucleic acid (see w34643) coding for such an antigen. The new formulations, which are useful as vaccine formulations, endict are suitable for therapeutic and prophylactic use. An adequate response is produced even without adjuvant. A second, claimed 29 kDa antigen (see w60156) is provided that differs only at residue 222 (Ser for Arg).
                                                                                                                                                                                                                                          Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         This polypertide comprises a 29 kDa surface antigen which is expressed on the surface of both dividing (bacillary) and resting (colloid) forms of Helicobacter pylori. The antigen gives rise to both systemic and local (mucosal) production of antibodies. It is an adhesin that is conserved in all tested strains of H. pylori, and is also a putative virulence factor. The invention relates to a new pharmaceutical composition comprising a lipid aggregate of a negatively charged lipid or lipid mixture and at least one antigenic, native or recombinant antigen of H. pylori, preferably the surface-exposed 29 kDa antigen, or a nucleic acid (see v34642) coding for such an antigen. The new formulations, which are useful as vaccine formulations, elicit a protective immune response against H. pylori infections, and are suitable for therapeutic and prophylactic use. An adequate response is produced even without adjuvant. A second 29 kDa antigen (see W60157) is provided that Sequence 260 AA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Query Match

C A 29 kDa antigen (W07449) of Helicobacter pylori is an adhesin expressed on the surface of resting and dividing forms of the bacterium. It is conserved in all tested strains of H. pylori, and gives rise to both systemic and local (mucosal) prodn. of antibodies. Its amino acid sequence was deduced from a cDNA clone (T43834); a sequence (W07550) deduced from a second cDNA clone (T43835) differs only at position 222 (Arg for Ser). Recombinant antigen can be produced in transformed host cells. It is useful for the diagnosis and treatment of H. pylori infections and for series as a vaccine.

Chimeric - Helicobacter pylori.
Chimeric - Vibrio cholerae.
Fusion gene consisting of the Helicobacter pylori adhesin gene
ligated to the A2 and B subunit gene of Vibrio cholerae toxin
useful in the diagnosis and treatment of H. pylori

  infections (1) Page 207-208; 279pp; English.
Claims 27, 31; Page 207-208; 279pp; English.
Recombinant or substantially pure preparations of H. pylori polypeptides are disclosed, together with the nucleic acids encoding them. In all, 73 ORFs are shown. The proteins are variously cell envelope proteins, secreted proteins or other cellular proteins. Vaccines containing the nucleic acids or proteins are claimed, as are probes containing at least 8 nucleotides from the nucleic acid sequences. The vaccines are useful for treating or reducing the risk of H. pylori infections, and the probes can be used diagnostically for detecting the presence of Helicobacter in a sample. The products are also of use in screening for compounds having the ability to interfere with the H. pylori life
                                                                                                                                                                                                                                                                                                                                                                                               Alm RA, Smith D;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              H. pylori adhesin gene, and the V. cholerae toxin A2 and B subunit genes. This protein is used in the diagnosis of and as a vaccine against H. pylori, which is the main cause of gastritis and gastric/duodenal ulcers. It may also be used in the production of an anti-H. pylori antibody. Vectors containing the DNA sequence and E. coli strains containing it form the basis of a process to produce the protein, which consists of culturing the microorganism and obtaining the protein. The protein is an effective vaccine against H. pylori due to its excellent immunogenicity for H. pylori, stability within the stomach environment, and its ability to penetrate through the stomach mucous membrane to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             (ASTR
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Helicobacter pylori.

                                                                                                                                                                                                                           Pf Helicobacter pylori nucleic acid sequences and related Pf polypeptide(s) - useful for vaccines to treat or prevent H. pylori Pf infection, and to detect Helicobacter Displosure; Page 1363-64; 1481pp; English.

CC This sequence represents a H. pylori protein.

CC The protein may be used in a vaccine to prevent or treat H. pylori CC infection or to identify H. pylori polypeptide binding compounds; CC useful as potential H. pylori life cycle activators or inhibitors.

CC The genomic sequence of H. pylori (ATCC 55679) was determined from CC overlapping contigs generated by mechanically shearing the bacterial CC DNA. The sequences were analysed for ORF of at least 180 nucleotides, and the predicted coding regions defined by computer evaluation. To identify likely H. pylori antigens for vaccine development, the amino acid sequences predicted from various ORF were analysed for significant homology to other known or exported membrane proteins. Having identified C1 solated from H. pylori by PCR amplification for recombinant polypeptide production, e.g. in E. coli hosts.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Š

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Š
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     맑
                                                                                                                                                                                                                                                                                                                                                                                             This sequence represents an H. pylori derived protein, no further details are given in the specification.

C details are given in the specification.

C Helicobacter pylori has been strongly linked to chronic gastritis and duodenal ulcer disease. The nucleic acid sequences of the invention are used to evaluate compounds, especially activators or inhibitors of bacterial life cycle, for the ability to bind an H. pylori nucleic acid sequences. The nucleic acid sequences, and corresponding proteins, are also useful for generating vaccines for immunising subjects against H. pylori or or use in detecting the presence of Helicobacter species in a sample. Antisense nucleic acid sequences of these sequences are used to inhibit expression of a gene from Helicobacter species. H. pylori whole genomic DNA was isolated and nebulised to a median size of pylori whole genomic DNA was isolated and nebulised to a median size of pylori-linker adapters in 100-1000 fold molar excess. These linkers are complementary to the BstXI-cut pMPX vectors, while the overhang is not self-complementary. Thesefore the linkers will not concatemerise nor will the cut vector re-ligate itself easily. The linker-adapter inserts were ligated to each of the 20 pMPX vectors to construct a series of sequenced.
                                                                                                                                                                                                                                                                Query Match

Disclosure; Page 655; 1481pp; English.

The present sequence is a H. pylori derived protein, no further details are given in the specification.

The protein may be used in a vaccine to prevent or treat H. pylori infection or to identify H. pylori polypeptide binding compounds, infection or to identify H. pylori life cycle activators or inhibitors.

The genomic sequence of H. pylori (ATCC 55679) was determined from cverlapping contigs generated by mechanically shearing the bacterial DNA. The sequences were analysed for ORF of at least 180 nucleotides, and the predicted coding regions defined by computer evaluation. To identify likely H. pylori antigens for vaccine development, the amino acid sequences predicted from various ORF were analysed for significant homology to other known or exported membrane proteins. Having identified and determined the sequences of interest, particular regions can be isolated from H. pylori by PCR amplification for recombinant polypeptide production, e.g. in E. coli hosts.

Helicobacter pylori nucleic acid sequences and encoded polypeptide(s) - useful in vaccines to treat or prevent H. pylori infection and for diagnosis of H. pylori infection Claims 14,80; Page 653; 1145pp; English.

This sequence is a H. pylori cell envelope outer membrane protein (OMP) The protein may be used in a vaccine to prevent or treat H. pylori infection or to identify H. pylori polypeptide binding compounds, useful as potential H. pylori life cycle activators or inhibitors. The DNA and probes derived from it may be used for the identification of

PR Helicobacter pylori nucleic acid sequences and encoded prolypeptide(s) - useful in vaccines to treat or prevent H. pylori prolypeptide(s) - useful in vaccines to Infection

PT infection and for diagnosis of H. pylori infection

PT infection and for diagnosis of H. pylori infection.

CC This sequence is a H. pylori protein of unspecified function.

CC This sequence is a H. pylori protein of unspecified function.

CC The protein may be used in a vaccine to prevent or treat H. pylori

CC infection or to identify H. pylori polypeptide binding compounds,

CC useful as potential H. pylori life cycle activators or inhibitors. The

CC UNA and probes derived from it may be used for the identification of

CC UNA and probes derived from it may be used for the identification. Nucleic

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           H. pylori in a sample and the diagnosis of H. pylori infection. Nucleic acid sequences complementary to the DNA act as antisense sequences and can be used to prevent the translation of H. pylori mRNA. Antibodies against the protein can be used in immunoassays to evaluate the abundance and distribution of H. pylori-specific antigens. The genomic sequence of H. pylori (ANCC 5679) was determined from overlapping contigs generated by mechanically shearing the bacterial DNA. The sequences were analysed for ORF of at least 180 nucleotides, and the predicted coding regions defined by computer evaluation. To identify likely H. pylori antigens for vaccine development, the amino acid sequences predicted from various ORF were analysed for significant homology to other known or exported membrane proteins. Having identified and determined the sequences of interest, particular regions can be isolated from H. pylori by PCR amplification for recombinant polypeptide production, e.g. in E. coli
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Query Match

                                                                                                                                          New isolated Helicobacter polynucleotides - used to develop products for the diagnosis, prevention and treatment of Helicobacter infections and gastrointestinal diseases Claim 8; Page 455-456; 2054pp; English.

This sequence represents a Helicobacter pylori GHPO protein of the invention. The polypeptides can be used for preventing or treating the inventions, including acute, chronic, and atrophic gastritis, and peptic ulcer diseases, e.g. gastric and duodenal ulcers. They can also be used for the production of antibodies. The products can also be used for the production of antibodies. The products can also be used for the production of antibodies.

Antibodies against the protein can be used in immunoassays to evaluate the abundance and distribution of H. pylori-specific antigens. The genomic sequence of H. pylori (ATCC 55679) was determined from overlapping contigs generated by mechanically shearing the bacterial DNA. The sequences were analysed for ORF of at least 180 nucleotides, and the predicted coding regions defined by computer evaluation. To identify likely H. pylori antigens for vaccine development, the amino acid sequences predicted from various ORF were analysed for significant homology to other known or exported membrane proteins. Having identified and determined the sequences of interest, particular regions can be isolated from H. pylori by PCR aminificant homology can be isolated from H. pylori by PCR aminificant homology can be isolated from H. pylori by PCR aminificant homology can be isolated from H. pylori by PCR aminificant homology can be isolated from H. pylori by PCR aminificant homology can be isolated from H. pylori by PCR aminificant homology can be isolated from H. pylori by PCR aminificant homology can be isolated from H. pylori by PCR aminificant homology can be isolated from H. pylori by PCR aminificant homology can be isolated from H. pylori by PCR aminificant homology can be isolated from H. pylori by PCR aminificant homology can be isolated from H.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          peptic ulcer disease

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Recombinant or substantially pure preparations of H. pylori polypeptides are disclosed, together with the nucleic acids encoding them. In all, 73 ORFs are shown. The proteins are variously cell envelope proteins, secreted proteins or other cellular proteins. Vaccines containing the nucleic acids or proteins are claimed, as are probes containing at least 8 nucleotides from the nucleic acid sequences. The vaccines are useful for treating or reducing the risk of H. pylori infections, and the probes can be used diagnostically for detecting the presence of Helicobacter in a sample. The products are also of use in screening for compounds having the ability to interfere with the H. pylori life cycle or to inhibit H. pylori infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Helicobacter pylori nucleic acids and proteins - products for the detection, prevention and treatm
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  H. Dylori OrF 04-0-11108_3906963_fl_7 cell envelope protein. Vaccine: probe; diagnostic; ORF; cell envelope protein;

The protein may be used in a vaccine to prevent or treat H. pylori infection or to identify H. pylori polypeptide binding compounds, useful as potential H. pylori life cycle activators or inhibitors.

The genomic sequence of H. pylori (ATCC 55679) was determined from overlapping contigs generated by mechanically shearing the bacterial DNA. The sequences were analysed for ORF of at least 180 nucleotides, and the predicted coding regions defined by computer evaluation. To identify likely H. pylori antigens for vaccine development, the amino acid sequences predicted from various ORF were analysed for significant homology to other known or exported membrane proteins. Having identified and determined the sequences of interest, particular regions can be isolated from H. pylori by PCR amplification for recombinant polypeptide production, e.g. in E. coli hosts.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Query Match

This sequence represents a H. Pylori secreted or periplasmic protein. CC The protein may be used in a vaccine to prevent or treat H. Pylori infection or to identify H. Pylori polypeptide binding compounds, cc useful as potential H. Pylori life cycle activators or inhibitors. CC The genomic sequence of H. Pylori (ATCC 55679) was determined from coverlapping contigs generated by mechanically shearing the bacterial CC DNA. The sequences were analysed for ORF of at least 180 nucleotides, and the predicted coding regions defined by computer evaluation. To classify likely H. Pylori antipens for vaccine development, the amino CC identify likely H. Pylori antipens for vaccine development, the amino CC acid sequences predicted from various ORF were analysed for significant can't determined the sequences of interest, particular regions can be isolated from H. Pylori by PCR amplification for recombinant polypeptide production, e.g. in E. coli hosts.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        (ASTR ) ASTRA
